
Ensemble at 4 km horizontal resolution (GammaT_cal,4km). 2 km vs 4 km resolution test (notes/pd1_calibracion.md): Ocean0 whole-shelf melt differs by -0.05 % (4 vs 2 km), but this agreement is largely the calibration target (GammaT calibrated separately at each resolution to the same Ocean0 deep melt, pd0 K1), not independent evidence of convergence; the cavity |psi_bt| maximum differs by +125 %; the melt maps correlate at r = 0.91. pd0 H1 requires BOTH a quadratic fit with R^2 >= 0.98 AND a power law <m> = k (Tbot - T_f,GL)^n with n in [1.3, 2.0]; the curves in (a) are the quadratic fits, and n and the H1 verdict of each z_c are in its legend. Last 6 months (records 19-24) of each 2-year run. Open markers / hatched column: Tbot = 2.0 runs, Exp. 3 test data, not used in H1. Panel (c) is descriptive.
