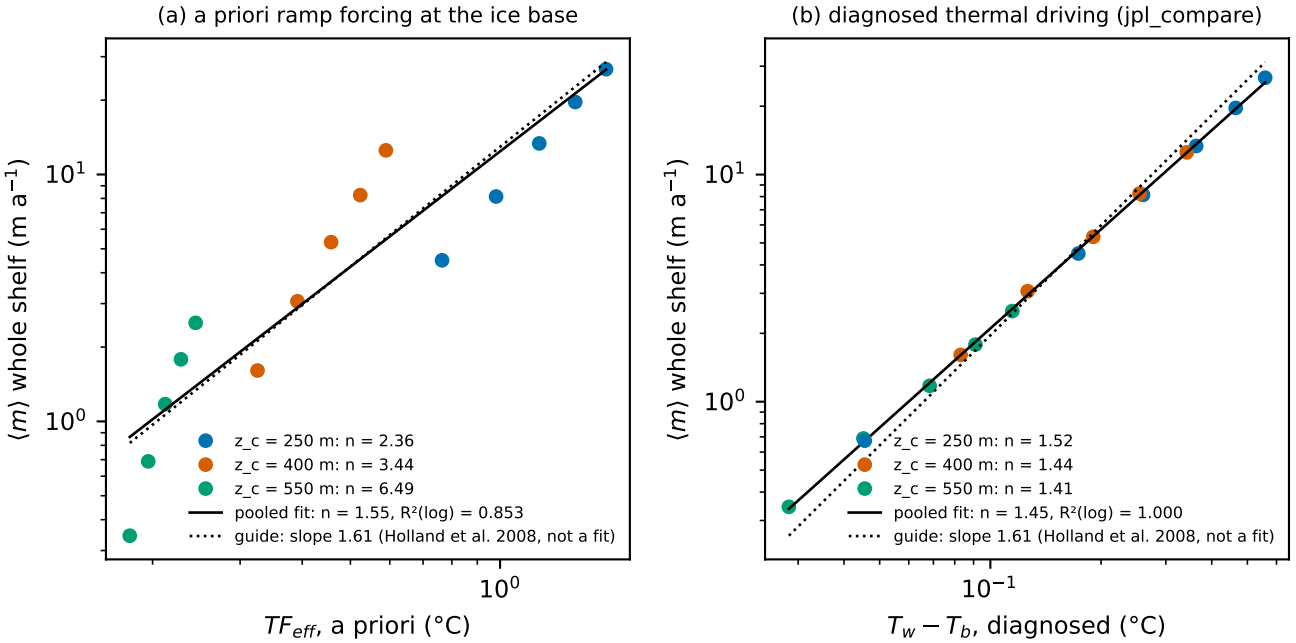
POST HOC (R23): whole-shelf melt against the forcing at the ice base



POST HOC, not a pre-registered test; the pd0 H1 verdict stays FAIL. 4 km core runs (s = 1, Tbot -0.5..1.5), last 6 months. (b): gammaT-weighted Tw - Tb inverted from AD16 Eq. 24.
(b) is partly circular: Tw - Tb = m L / (cw gammaT) is computed from m itself, so m = c gammaT (Tw - Tb) and its exponent is 1 + d ln<gammaT> / d ln(Tw - Tb) (the u* response), not an independent test.
