(a) The training data: the MITgcm runs of Exp. 2

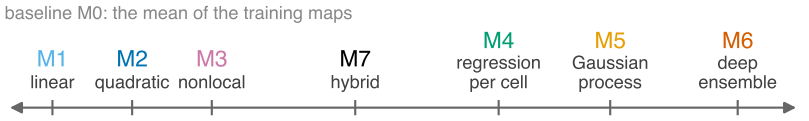

inputs: T_{bot}, z_c and s, three numbers per run

(b) Where each method is tested

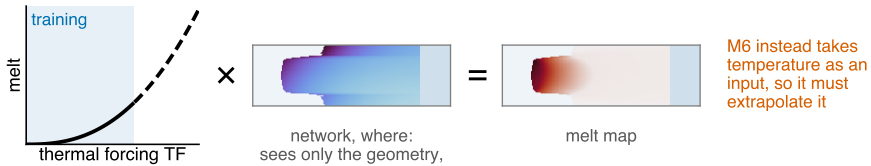

shaded: the training range (25 runs). loro hides each run in turn and predicts it, inside the range [H3b]; the other tests extrapolate.

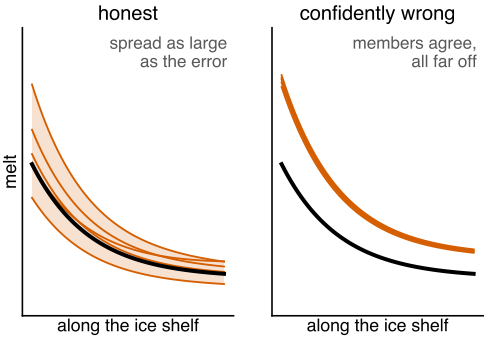

(c) Eight methods, from physics to data

The hybrid M7: $\text{melt} = K\,TF_+^n \times g_\theta(\text{geometry})$

(d) What H3c asks of the ensemble

black: MITgcm; orange: the 5 members of M6

H3c fails if any extrapolation case has spread < 5 % and integrated error > 20 %
